

CONCENTRATED SOLVENT PAINT STRIPPER

APPLICATIONS:

A liquid paint stripper for fast removal of highly polymerised modern coatings from metal surfaces. Will have slight attack on magnesium, zinc, aluminium and their alloys. PCS201 is a highly active stripper containing two activators and inhibitors. A wax seal prevents solvent loss. Components immersed in PCS201 are water rinsable.

METHOD OF USE:

Use as supplied in a mild steel tank. Wax seal will settle on top of the solution to prevent solvent loss.

Immerse components below the wax seal in a suitable wire mesh basket until paint has been removed.

Wash off components in water. Stripping tank should be fitted with a fine wire mesh sludge tray to remove stripped off paint residue. Do not heat; always use cold.

SAFETY PRECAUTIONS:

Always use in a well-ventilated area. Avoid contact with skin and eyes. Wash any splashes off with soap and water. Irrigate eyes with clean running water. For detailed health and safety request a hazard data sheet.

PACKAGING 25 litre drums. 205 litre drums available on request.
